

TPB series TORQUE POWDER BRAKE

FEATURES _____

■ Torque: 6...600 N·m

Power: ≤900W (2100W with air cooling)

Rated Torque available from 0 rpm

Stable Braking Torque

Low Moment of Inertia

Low Residual Torque

Operation in both Rotational Directions

Delivered with Foot Mount

For horizontal use only

Fig. 1: TPB 012 | Torque Powder Brake

DESCRIPTION _____

The Torque Powder Brakes (TPB Series) are ideal for applications operating in the low speed range or middle to-high torque range. These magnetic powder brakes provide full torque at zero speed and are convection or air cooled, allowing power ratings up to 900 W (2100 W with air cooling).

APPLICATIONS _____

These units are suited for tension control applications, such as wire winding, foil, film, and tape tension control. Mounted on test benches, TPB Series - Torque Powder Brakes allow performance and reliability testing on driving elements such as electric motors, hand-held power tools, geared motors, reduction gears, and hydraulic transmission systems. Other applications include load simulation for life testing on electric motors, actuators, gearboxes, power steering, and many other rotating devices and assemblies.

POWER SUPPLY_____

A constant-current DC current supply is recommended. Magtrol offers suitable supply options (see specific section on page 6).

COUPLING ____

Although intended for coupled service, moderate overhung loads can be tolerated depending on operating characteristics as speed, weight and center of gravity of the load. Care should be taken to ensure precise shaft alignment. Couplings should be of proper size and flexibility to adequately protect bearings from undue stress and shock loading.

OPERATING PRINCIPLES _____

The TPB Series Torque Powder Brakes contain, as their name suggests, a magnetic powder. The electrical current passing through the coil generates a magnetic field, which changes the property of the powder, thus producing a smooth braking torque through magnetic coupling between the rotor and stator. Magnetic powder brakes produce their rated torque from zero speed. The element to be tested can be loaded from zero speed to determine the starting torque. Without electrical excitation, the shaft rotates freely. Since the magnetic powder is always contained within the brake, all powder brakes have a minimum drag torque associated with them. With electrical excitation, the shaft becomes magnetically coupled. While the torque is less than the brake output torque, the shaft will not rotate. When the torque is increased, the brake will slip at the torque level set by the input current.

TECHNICAL DATA

MECHANICAL CHARACTERISTICS								
MODEL	RATED TORQUE (RT)	MAXIMUM SPEED	RATED CURRENT	VOLTAGE	NOMINAL ELECTRICAL POWER	KINETIC POWER RATINGS		
						Natural cooling		With
						Low speed ^{a)}	1000 rpm	air cooling
	N∙m	rpm	Α	VDC	W	W	w	w

TPB 600	6	2.45 x 10 ⁻¹	2449	2 70	120		

a) Power at low speed without the full effect of internal mechanical cooling.

CONTINUOUS BRAKING POWER.

For a short period of time, the brake may dissipate more power than expected. However, the average value of the derived power must not exceed the kinetic power rating shown in the table above. The following formula applies for continuous load operation.

POWER [W] = $\frac{\text{SPEED [rpm] x TORQUE [N \cdot m]}}{9.549}$

NOTE: Most values are in metric units. Dimensions are in millimeters.

NOTE: 3D STEP files of most of our products are available on our website: www.magtrol.com; other files are available on request.

a) TPB 006 is delivred without foot-mount. Mounting is only available from the front side fixtures

b) TPB 006 is not available with compressed air cooling.

POWER SUPPLIES

For optimum torque stability, Magtrol offers different power supplies for Brakes & Clutches:

MODEL 5212 & MODEL 5251 CURRENT REGULATED POWER SUPPLY

Fig. 2: MODEL5212

MODEL 5212 is a 0...1A current-regulated, 0...35 VDC power supply designed for use with hysteresis brakes & clutches such as HB, AH-B,...,TPB Series. s. It has a high input

impedance that allows for a variety of sensors and transducers to be used. It features a 10-turn current adjustment potentiometer and 3 selectable current ranges: 200, 500 &1000 mA. A built-in digital readout displays the output current value.

The MODEL 5212 is designed as a closed-loop power supply to provide smooth application of current throughout an entire range up to a maximum set point. By utilizing regulated current, fluctuations in brake torque caused by temperature changes within the brake coil are eliminated. Braking current can be controlled manually or by an external 0...5VDC input signal.

Fig. 3: MODEL5251

Alternatively, **MODEL 5251** offers the same features in an open-frame design for easy integration, connection to PLC, voltmeter, display or other monitoring device. Braking control is enabled either by a potentiometer, or by an external 0...5VDC control signal.

Z+ SERIES - POWER SUPPLY

Fig. 4: Z+ Series

The Z+ Series is a 0...36 VDC benchtop Power Supply which provides current regulation of the braking torque via a turning knob. This powerful and versatile power supply can power all Magtrol brakes, with an output current up to 6A. The Power Supply can be used in a desktop version or integrated into a 2U rack unit.

The Z+ Power Supply is required to power brakes with high kinetic power, which require supply currents greater than 3A (e.g. TPB 400, TPB 600, etc.). This unit can also be controlled with an analog input signal 0...4 V.

BPM SERIES - BRAKE POWER MODULE

Fig. 5: BPM 101

The BPM Series - Brake Power Module is used to supply and control the current (up to 3A) of Magtrol Hysteresis Brakes and Clutches. This compact component (DIN rail mount) is recommended for easily controlling a wide range of brakes and clutches.

The analog input of the Brake Power Module is designed for 0...10 VDC signals. At the maximum set value of 10 VDC, the output current is adjustable 0...100%.

OPTIONS & ACCESSORIES _

TS 100 SERIES - TORQUE SENSORS

Fig. 6: TS 110 & 104 | Torque Sensors

Magtrol's TS 100 Series In-LineTorque Sensors provide extremely accurate torque and speed measurement. Each model has an integrated conditioning electronic module providing 0...±10 VDC torque output through an 8-pole connector, as well as a USB interface which can be directly connected to a computer. The sensor is delivered with the TORQUE Software which allows easy connection and data acquisition. A speed encoder provides min. 360 PPR (pulses/rev.) in Tach A, Tach B and Index reference Z (1 pulse/revolution). Magtrol Torque Sensors are very reliable, providing high overload protection, excellent long-term stability and high noise immunity.

COUPLINGS

When torque transducers, powder brakes and other element are mounted in a drive train, special attention must be paid to the couplings that will connect the different elements The criteria for selecting appropriate couplings for torque measurement is as follows:

- · High torsional spring rate: Ensures a high torsional stiffness and angular precision
- Clamping quality (should be self-centering and of adequate strength)
- Speed range
- Balancing quality (according to speed range)
- Alignment capability

TM 300 SERIES - TORQUE TRANSDUCERS

Fig. 7: TM 309 & TM 308 | Torque Transducers

Magtrol's TM 300 Series offers three variations (Standard. Basic, High Speed) of torque transducers for dynamic torque and speed measurement. All three transducer models employ our unique non-contact differential transformer torque measuring technology. This measuring technology offers many benefits most notably that no electronic components rotate during operation. Each model has an integrated conditioning electronic module providing 0... ± 10 VDC torque output and an open collector speed output. Magtrol's Torque Transducers are very reliable, providing high overload protection, excellent long-term stability and high noise immunity.

The higher the speed of the application, the more care is required in selecting the coupling and assembling (alignment and balancing) the drive train configuration. Magtrol provides a wide range of couplings suitable for torque measurement applications and can assist you in choosing the right coupling for your transducer.
