MAGTROL

TF Series
Torque Flange Sensors

User’s Manual
## Purchase Record

Please record all model numbers and serial numbers of your Magtrol equipment, along with the general purchase information. The model number and serial number can be found on either a silver identification plate or white label affixed to each unit. Refer to these numbers whenever you communicate with a Magtrol representative about this equipment.

| Model Number: | _____________________________ |
| Serial Number: | _____________________________ |
| Purchase Date: | _____________________________ |
| Purchased From: | _____________________________ |

While every precaution has been exercised in the compilation of this document to ensure the accuracy of its contents, Magtrol assumes no responsibility for errors or omissions. Additionally, no liability is assumed for any damages that may result from the use of the information contained within this publication.

**COPYRIGHT**

Safety Precautions

**WARNING!** IN ORDER TO MINIMIZE RISKS, IT IS OF UTMOST IMPORTANCE TO RESPECT THE CURRENT SAFETY STANDARDS WHEN PLANNING, CONFIGURING AND OPERATING THE TORQUE MEASUREMENT DRIVE TRAIN.

**CAUTION:** OPERATE THE TF SERIES TORQUE FLANGE SENSOR WITH GREAT CAUTION! THE SENSOR MAY BE IRREVERSIBLY DAMAGED IF IMPACTED MECHANICALLY (FALL), CHEMICALLY (ACIDS) OR THERMALLY (HOT AIR, VAPOR).

1. Make sure that all Magtrol electronic products are earth-grounded, to guarantee personal safety and proper operation.
2. Check line voltage before operating electronic equipment.
3. Make sure that all rotating parts are equipped with appropriate safety guards.

**Note:** Detailed information regarding safety guards can be found in Section 2.6 – Protective Systems.

4. Periodically check all connections and attachments.
5. Always wear protective glasses when working close to rotating elements.
6. Never wear a necktie or baggy clothes when standing close to rotating elements.
7. Never stand too close or bend over the rotating drive chain.

**QUALIFIED PERSONNEL**

Persons in charge of installing and operating the TF Series Torque Flange Sensor must have read and understood this User’s Manual, paying extra close attention to all safety-related information.

The TF Sensor is a high-precision product integrating the most recent measurement techniques. The sensor can give rise to residual dangers if used and manipulated in a non-compliant way by unqualified personnel.

This sensor must be handled by qualified personnel according to the technical requirements and the above-mentioned safety instructions. This is also true when using torque flange accessories.
RESIDUAL HAZARDS

Sensor performance is only one element in torque measurement. Safety is of equal importance. There are possible residual hazards when operating rotating test equipment and it is the responsibility of the designer, the manufacturer and the user to minimize these hazards.

In addition to general safety precautions, residual hazards are highlighted in this manual by using the following symbols:

![Warning Symbol]  ![Stop Symbol]

*Please read the Preface for a more detailed description of each symbol.*

PROPER USE

The use of TF Series Torque Flange Sensors is exclusively restricted to torque and rotational speed measuring tasks and directly-related control and regulating tasks. Any further use shall be deemed to be improper.

For safe operation, the TF Sensor and its accessories may only be used according to the data and specifications given in this User’s Manual. Safe operation can be guaranteed only when the sensor is correctly transported, stored, installed, mounted and used.

MODIFICATIONS

The TF Torque Flange Sensor and its accessories may not be modified without the express consent of Magtrol. Magtrol is not be liable for any consequential damages resulting from unauthorized modifications.
Revisions to This Manual

The contents of this manual are subject to change without prior notice. Should revisions be necessary, updates to all Magtrol User’s Manuals can be found at Magtrol’s website at www.magtrol.com/support/manuals.htm.

Please compare the date of this manual with the revision date on the website, and then refer to the manual’s Table of Revisions for any changes/updates that have been made since this edition.

PURPOSE OF THIS MANUAL

This manual contains all the information required for the setup, connection and general use of Magtrol’s Torque Flange Sensors of TF series. Please read this manual in its entirety before operating. Keep the manual in a safe place for quick reference whenever a question should arise.

WHO SHOULD USE THIS MANUAL

This manual is intended for those who install Torque Flange Sensors on a bench test or to use it to determine the couple on a transmission chain. The operator is assumed to have the necessary technical training in mechanical engineering and electronics to enable him to install these Torque Flange Sensors.

MANUAL ORGANIZATION

This section gives an overview of the structure of the manual and the information contained within it. Some information has been deliberately repeated in different sections of the document to minimize cross-referencing and to facilitate understanding through reiteration.

The structure of the manual is as follows:

Chapter 1: INTRODUCTION – Contains the technical data sheets for the Torque Flange Sensors of TF series, which describe the units and provide an overview of their possible applications.

Chapter 2: INSTALLATION/CONFIGURATION – Provides the information needed for the setup and connection of the Torque Flange Sensors.

Chapter 3: STARTUP – Give the instructions to start the system and adjust the zero of the measuring chain.

Chapter 4: MEASUREMENT CONSIDERATIONS – Describes the limits of measures.

Chapter 5: OPERATING PRINCIPLES – Contains information on lubrication procedures and provides recommendations for the calibration and checking of the measuring current and voltage.

Chapter 6: TROUBLESHOOTING/MAINTENANCE – Give the procedure to follow in case of breakdown of a Torque Flange Sensors TF.
CONVENTIONS USED IN THIS MANUAL

The following symbols and type styles may be used in this manual to highlight certain parts of the text:

**Note:** This is intended to draw the operator’s attention to complementary information or advice relating to the subject being treated. It introduces information enabling the correct and optimal function of the product.

**Caution:** This is used to draw the operator’s attention to information, directives, procedures, etc. which, if ignored, may result in damage to the material being used. The associated text describes the necessary precautions to take and the consequences that may arise if these precautions are ignored.

**Warning!** This introduces directives, procedures, precautionary measures, etc. Which must be executed or followed with the utmost care and attention, otherwise the personal safety of the operator or third party may be at risk. The reader must absolutely take note of the accompanying text, and act upon it, before proceeding further.
1. Introduction

1.1 SYSTEM COMPONENTS

The complete TF Series torque measuring system consists of the following four primary components:
1. Measuring Flange with Signal Amplifier
2. HF Transmitter
3. Conditioner
4. Coaxial Cable (4 m)

System options include the Speed Sensor and Conditioner, and the 3411 Display

1.1.1 MEASURING FLANGE

The measuring flange represents the rotor part of the torque sensor. It is made of steel and contains 4 strain gauges in full-bridge configuration, an amplifier, a low-pass filter and an A/D converter. It is fitted with an electromagnetic track around its circumference which acts as an antenna for sending telemetric transmissions to the HF transmitter and, ultimately, the conditioner.

1.1.2 HF TRANSMITTER

The high-frequency transmitter represents the stator part of the transducer. This transmitter receives the signal from the measuring flange and relays it to the conditioner.
1.1.3 **Conditioner**

The torque conditioner supplies power to the measuring flange, via the HF transmitter, and collects the torque signal measured by the system. To display measured values, the conditioner must be connected to a Magtrol 3411 Torque Display (see Section 1.1.6 – Signal Processor/Display Unit) or similar device.

*Figure 1–2 Conditioner for TF 309 – TF 312 and TF 213 – TF 217 Torque Flange Sensors*

1.1.4 **Coaxial Cable**

The shielded RG-58 coaxial cable between the HF transmitter and the conditioner has an impedance of 50 Ohms and is 4 meters long (8 m, 12 m, 16 m and 20 m cables are available as an option).
1.1.5 **Speed Measurement Option**

When ordered with the optional speed measurement capability, the TF Torque Sensor is fitted with a toothed rim with the speed sensor attached to the exterior (as shown in the figure below).

![Mounted TF Torque Flange Sensor with Speed Measurement Option](image)

1.1.6 **Signal Processor/Display Unit**

Available as a system option, Magtrol's 3411 Torque Display processes the torque and speed signals from the TF Sensor and displays the measured values and calculated power. For additional data processing, the unit has an Ethernet interface for connection to a PC and is delivered with Magtrol's Torque 7 Software.

Torque 7 is a user-friendly Windows® executable program, developed under LabVIEW™, used to automatically collect torque, speed and mechanical power data. The data can be printed, displayed graphically or quickly saved as a Microsoft® Excel spreadsheet.

### 1.2 DATA SHEET

**Couplemètre plat**

**Série TF**

---

**CARACTÉRISTIQUES**

- Système de mesure complet comprenant :
  - Couplemètre avec amplificateur de signal
  - Transmetteur HF
  - Conditionneur
  - Câble coaxial 4 m
- Transmission sans contact du signal par télémétrie
- Couple : 50 N·m à 150 000 N·m (plus grand sur demande)
- Précision : 0,1% à 0,25% (0,05% optionel)
- Surcharge admissible : jusqu’à 200% (limite d’adhérence)
- Plage de mesure : 200%
- Surcharge de rupture : 400%
- Compact et facile à monter
- Grande rigidité en torsion
- Absence de roulements : sans usure ni maintenance
- Excellente immunité au bruit et résistance aux chocs
- Classe de protection : IP 42 (IP 54 option)
- Tension d’alimentation standard 24 V DC
- Capteur de vitesse (option) : mesure de la vitesse de rotation
- Utilisation à haute température : jusqu’à 125 °C (option)

---

**DESCRIPTION**

Grâce à sa conception, qui rend toute maintenance inutile du fait de l’absence de roulements, le couplemètre plat TF de Magtrol propose une solution compacte offrant de nombreux avantages. Sa grande rigidité en torsion permet de le monter directement sur l’axe de la machine ou sur la bride, évitant ainsi l’utilisation d’un accouplement sur un côté. Ceci permet un intégration aisée dans toute installation de mesure, tout en réduisant la taille et le coût.

Le couplemètre plat TF fait appel à un système de télémétrie pour transmettre avec grande précision les signaux provenant d’un pont de mesure à jauges de contrainte. Un amplificateur de signal embarqué conditionne le signal avant de le moduler à haute fréquence et de le transmettre par induction au conditionneur, via le transmetteur HF. Au niveau du conditionneur, ce signal numérique est transformé en une sortie analogique ±5 V DC. Un capteur à magneto-résistances (option) permet de mesurer la vitesse de rotation et de la convertir en un signal TTL.

La transmission sans contact reste opérationnelle avec un espace de 5 mm entre l’antenne du couplemètre et le transmetteur HF et permet un désalignement radial ou axial entre ceux-ci. Un autre avantage du système est son innocuité aux interférences électromagnétiques – contrairement aux autres conceptions, le transmetteur HF ne doit pas faire le tour du capteur. De plus, un système de protection peut être monté sans causer d’interférences.

---

**APPLICATIONS**

Le couplemètre plat TF permet de mesurer aussi bien les couples statiques que dynamiques sur des axes en rotation ou au repos. Ils peuvent être intégrés à des bancs de test pour moteurs à combustion et électriques ou de boîte à vitesse. Ils servent aussi à surveiller le couple dans des transmissions, des éoliennes, des turbines à gaz, des moteurs de bateau, etc.

OPTIONS DU SYSTÈME

Afficheur de couple modèle 3411
Magtrol propose l’afficheur de couple 3411. Il permet d’alimenter tous les coulemètres plats TF et d’afficher les valeurs de couple et de vitesse. Ses spécifications comprennent :
- Mesure du couple en unités métriques, anglaises ou SI
- Affichage à fluorescence sous vide de grande dimension
- Fonction de test intégrée
- Indicateur de surcharge
- Fonction de tarage
- Connexion Ethernet
- Sorties pour les valeurs de couple et de vitesse de rotation
- Calibrage piloté par menu
- Inclus logiciel Magtrol Torque 7

Logiciel de test Torque 7
Le logiciel de test Torque 7 de Magtrol, simple à utiliser, fonctionne sous Windows®. Il permet d’acquérir automatiquement des données de couple, de vitesse de rotation et de puissance, de les imprimer, de les représenter graphiquement et de les exporter dans un tableau Microsoft® Excel. Ce logiciel dispose également de fonctions standards d’acquisition de valeurs crêtes et de présentations graphiques combinées de courbes de mesure.

Accouplements
Pour votre couplomètre plat série TF, Magtrol propose les accouplements de la série BSD Moduflex® 9200 ou à soufflet métallique de la série BKC.
Pour plus de détails, contacter votre office régional de vente.
2. Installation / Configuration

**CAUTION:** BEFORE COMPLETING THE ASSEMBLY AND MOUNTING, IT IS ADVISED TO FIRST POWER UP THE SYSTEM *(SEE SECTION 3.1)* IN ORDER TO CHECK THE SIGNAL TRANSMISSION.

![Installation Overview Diagram](Image)

**Figure 2–1 Installation Overview**

### 2.1 INITIAL CLEANING

Prior to installing the TF Series Torque Flange Sensor, all contact surfaces including the measuring flange, coupling element and mounting flange must be carefully cleaned and degreased. This will guarantee optimal transmission of the measured torque signal.

Use a soft cloth lightly dampened with alcohol to avoid any abrasion. Be careful to prevent any alcohol from entering the flange or coming in contact with the rotor antenna during cleaning.

**CAUTION:** AVOID ANY USE OF OVERLY AGGRESSIVE SOLVENTS. THESE CAN DAMAGE THE ROTOR ANTENNA WHILE CLEANING. IF NECESSARY, ACETONE MAY BE USED (INSTEAD OF ALCOHOL) TO REMOVE ENCRUSTED DEPOSITS.

It is advised to clean all flange and coupling contact surfaces each time the drive train is reconfigured.
2.2  MEASURING FLANGE MOUNTING

2.2.1  ALIGNMENT

The TF Series Torque Flange Sensors are easy to install by design. However, it is important to achieve the best possible alignment of the various components of the measurement drive train. Angular and radial misalignments (as illustrated below) must be avoided.

![Figure 2–2  Angular and Radial Misalignment](image)

The admissible angular and radial misalignment is 0.3° and 0.04 mm, respectively. By using proper couplings, modest misalignments can be compensated.

2.2.2  COUPLING SELECTION

To avoid excessive extraneous loads, do not couple the driving elements directly to the driven part of the measuring chain by means of the measuring flange. A coupling is necessary.

![Figure 2–3  Incorrect Mounting](image)
2.2.2.1 Couplings for Angular Misalignment

In case of a slight angular error, a one-piece lamella coupling, cardan shaft or bellows coupling may be used.

![Coupling Options for Angular Misalignment Correction](image)

2.2.2.2 Couplings for Radial Misalignment

If the shaft mounting shows a slight radial misalignment, a two-piece lamella coupling, double cardan shaft or bellows coupling may be used. These elements provide the system with two degrees of freedom in order to compensate for a slight radial misalignment.

![Coupling Options for Radial Misalignment Correction](image)
2.2.3 Mounting Considerations

<table>
<thead>
<tr>
<th>Mounting Flange and Coupling Specifications</th>

<tr>
<td>Minimum Tensile Strength</td>
</tr>
<tr>
<td>Minimum Hardness</td>
</tr>
<tr>
<td>Roughness</td>
</tr>
<tr>
<td>Minimum Face Flatness</td>
</tr>
<tr>
<td>Centering Tolerance Ø</td>
</tr>
</tbody>
</table>

- The mounting flange or coupling mounted on the same side as the rotor antenna must have a diameter equal to or smaller than the rotor antenna diameter.
- To achieve the best possible centering of the measuring flange, the mounting flanges and couplings should use a centering device with a g6 tolerance on the outside diameter as illustrated in Figure 2–6 Mounting Flange and Coupling Specifications. The measuring flange is fitted with a centering bore (tolerance H7) on each face.

**Note:** If the mounting flange is also fitted with a centering bore, an intermediate centering washer may be used (see Figure 2–8 Mounted TF).

- A minimum distance of 10 mm between the main body of the mounting flange and its center piece (as illustrated in Figure 2–7 Measuring Flange Spacing) is necessary to avoid any disturbance when transmitting the HF telemetry signal.
• Check the lengths of the screws and be sure to avoid any contact between the screws and the opposite part of the measuring flange (see Figure 2–8 Mounted TF).
• Ensure a 0.1 to 0.2 mm clearance between the centering hole of the measuring flange and the mounting flange centering washer.

Figure 2–8 Mounted TF
### 2.2.4 Mounting Procedure

Since all TF Sensors are reversible, the component that is to be mounted on the same side as the measuring flange's rotor antenna must be mounted first. The options/mounting orders are as follows:

<table>

The mounting screws must be tightened in the following order.

![Screw Tightening Order](image)

*Figure 2–9 Screw Tightening Order*

Note: When faced with alternating loads, secure the screws in their threads with thread locker in order to avoid any loss of preload. Be sure to prevent the thread locker from spilling over.
2.2.4.2 Attaching the Mounting Flange to the Measuring Flange

Screw the measuring flange onto the mounting flange, firmly attaching it to the driving shaft, as shown in the figures below.

![Figure 2–10 Flange Mounting of TF 309 to TF 312 and TF 220 Sensors](image1)

![Figure 2–11 Flange Mounting of TF 213 to TF 219 Sensors](image2)

2.2.4.3 Attaching the Coupling to the Measuring Flange/Mounting Flange Assembly

Screw the single- or double-element coupling, or cardan shaft, onto the measuring flange.

2.2.4.5 Attaching the Mounting Flange to the Measuring Flange/Coupling Assembly

![Mounting Flange to Measuring Flange/Coupling Assembly](image3)

Figure 2–15  Mounting Flange to Measuring Flange/Coupling Assembly

Note: When using a cardan shaft, Magtrol recommends the latest generation of GKN series 687 cardan shafts with limited weight. Do not use the over weighted old cardan shafts. Proper mounting position of the cardan shaft is necessary to ensure proper balancing. Standard applications using a cardan shaft should not exceed 1500-2000 rpm, depending on size and deflection angle.
2.3  HF TRANSMITTER MOUNTING

Mount the HF transmitter according to the following specifications:

- The HF transmitter must be perfectly centered (laterally) with the rotor antenna and also aligned with the measuring flange axis.
- A gap of 2 mm for TF 309 to TF 312 and TF 213 to TF 217 Sensors and 3 mm for TF 218 to TF 220 Sensors must be maintained between the HF transmitter and rotor antenna in order to guarantee the best possible signal transmission.
- The HF transmitter must be mounted onto a support which can be easily adjusted both horizontally and vertically. To prevent any disturbance of the transmitted signal, the support must be at least 10 mm away from the HF transmitter rim (see Figure 2–16 HF Transmitter Installation). The support must also be stable in order to prevent excessive vibrating of the HF transmitter and, consequently, avoid electromagnetic coupling problems between the rotor antenna and the HF transmitter.

![Figure 2–16 HF Transmitter Installation](image)

2.4  SPEED SENSOR MOUNTING

If the TF Torque Flange Sensor is ordered with optional speed measurement capabilities, the HF Transmitter and the speed sensor must be mounted offset from each other with at least a 90° angle, as shown in Figures 2–17 and 2–18.
2.4.1 **Standard Sensors**

The speed sensor must be placed at a 1.5 mm distance from the measuring flange in order to optimize detection.

![Figure 2–17 Standard Speed Sensor Installation](image)

2.4.2 **High-temperature Sensors**

The high-temperature speed sensor, delivered with TF Torque Flange Sensors ordered with extended temperature range, must be placed at a 0.5 mm to 2 mm distance from the teeth with a 10° angle to optimize detection.

![Figure 2–18 High-temperature Speed Sensor Installation](image)
2.5 ELECTRICAL CONNECTIONS

Having installed the measuring flange and HF transmitter, only two electrical cables (three, with speed measurement option) need to be connected for the system to be operational.

![Diagram of conditioner connections]

Avoid running the ER-116/117 signal cable, coaxial cable and speed sensor connection cable through an environment which may be perturbed by electromagnetic fields. These cables should also not be run close to transformers, electric motors or motor drives. If running these TF Torque Flange Sensor cables through such environments cannot be avoided, a minimum distance of 2 feet from potentially perturbing components should be respected.

Ideally, these cables should be housed in steel conduit and connected to earth ground, to protect them as much as possible from electromagnetic perturbations.

2.5.1 CONNECTING THE HF TRANSMITTER TO THE CONDITIONER

**CAUTION:** NEVER SHORTEN THE COAXIAL CABLE. THE SYSTEM HAS BEEN TUNED IN ORDER TO OPTIMIZE THE HF TRANSMISSION USING THE COAXIAL CABLE’S ORIGINAL LENGTH (AS DELIVERED).

Connect the HF transmitter to the conditioner with the supplied coaxial cable, utilizing the dedicated connectors. (See Figure 2–19 Conditioner Connections.)

2.5.2 CONNECTING THE (OPTIONAL) SPEED SENSOR TO THE SPEED CONDITIONER

Connect the speed sensor to the speed conditioner with the supplied connection cable, utilizing the dedicated connectors. (See Figure 2–19 Conditioner Connections.)
2.5.3 CONNECTING THE CONDITIONER TO A SIGNAL PROCESSOR/DISPLAY UNIT

2.5.3.1 Conditioner Connector

For connection to a signal processor/display unit such as a Magtrol 3411 Torque Display or DSP7001 Controller, the conditioner is equipped with a 9-pin D-sub connector.

![Figure 2–20 Conditioner Connector Pin Configuration](image)

2.6 PROTECTIVE SYSTEMS

WARNING! ALL ROTATING PARTS MUST BE FITTED WITH A PROTECTIVE SYSTEM TO ENSURE THAT THE USER, AS WELL AS ALL OTHER SURROUNDING PEOPLE AND OBJECTS, WILL NOT BE INJURED OR DAMAGED AS A RESULT OF THE DRIVE ELEMENT BECOMING BLOCKED, A TORQUE OVERLOAD, OR ANY OTHER POTENTIAL PROBLEM.

The following precautions concerning protective equipment of the drive train must be observed:

- Protective elements must prevent access to moving parts (during test).
- Protective elements must cover all parts which can cause crushing or cutting, and protect against projections of parts having become loose.
- Avoid attaching protective elements to rotating parts.
- A minimum space of at least 12 mm should be maintained between rotating parts and protective elements.
Figure 2–23  Spacing Between Flange and Guard

*Figure 2–24* shows a good example of a protective system. All parts of the bench are accessible, but the cover prevents any risk to the user when closed.

*Figure 2–24  Example of Protective System*
3. Startup

3.1 POWERING UP THE SYSTEM

1. Switch the system on (power up).
2. Check that all LEDs are illuminated. (If this is not the case, refer to Section 6.2 – LED Indicators).

<table>

*Figure 3–2  Red LED*
3.2 OFFSET AND GAIN

Offset and gain of TF Series Torque Flange Sensors are calibrated before delivery. However the zero (offset) may have drifted slightly after mounting the measuring flange (surface flatness, fastening torque of the screws, parasitic forces).

If necessary, proceed as follows:

1. Completely unload the measuring chain (no force should be applied to the TF Sensor).
2. Adjust the torque output signal by means of the "Offset" potentiometer placed inside the conditioner in order to obtain a zero value for the torque (0 N·m = 0.000 V).

Figure 3–3 Zero Calibration of 1.5 W Conditioner (TF 309–312 and TF 213–217 Sensors)

Figure 3–4 Zero Calibration 5 W Conditioner (TF 218 to TF 220 Sensors)

CAUTION: NEVER TOUCH THE "GAIN" ADJUSTMENT SCREW. IT IS ONLY USED AFTER A CONDITIONER REPLACEMENT OR REPAIR.
4. Measurement Considerations

**CAUTION:** WHEN PERFORMING STATIC MEASUREMENTS, IT IS POSSIBLE TO GO BEYOND NOMINAL TORQUE AND TOWARD THE TORQUE LIMIT WHICH CAUSES PLASTIC DEFORMATION. WHEN EXCEEDING THE NOMINAL TORQUE, ANY EXTRANEOUS LOADS SUCH AS AXIAL, SHEARING AND BENDING FORCES MUST BE AVOIDED.

### 4.1 DYNAMIC TORQUE

Static and dynamic measurements differ from one another by the evolution of torque over time. A constant torque produces static measurements, whereas varying torques can only be determined by dynamic measurement. TF Torque Flange Sensors have been designed to measure both static and dynamic torque.

### 4.2 DETERMINING THE NATURAL FREQUENCY OF A DRIVE TRAIN

**CAUTION:** CRITICAL ROTATIONAL SPEEDS AS WELL AS NATURAL FREQUENCIES HAVE TO BE TAKEN INTO CONSIDERATION IN ORDER TO AVOID RESONANCES AND POSSIBLE OVERLOADING OF THE TF TORQUE FLANGE SENSOR.

In order to determine the dynamic torque and frequency response, and to prevent any damage to the system, it is necessary to calculate the natural frequency of the drive train's torsional oscillations.

The drive train is considered a combination of torsion springs with intermediate flywheel masses. In the TF Sensor, the deformation area of the measuring flange is the weakest link in the rotating measuring chain and is subject to torsional vibrations. A good approximation of the dominant torsional resonant frequency is given in the following formula:

\[
f_0 = \frac{1}{2\pi} \sqrt{\frac{C}{J_1 + J_2}} \cdot \frac{1}{J_1 \cdot J_2}
\]

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f_0 )</td>
<td>System natural frequency [Hz]</td>
</tr>
<tr>
<td>( C )</td>
<td>Torsional stiffness of the flange [N·m/rad]</td>
</tr>
<tr>
<td>( J_1 )</td>
<td>Moment of inertia (driving element + mounting flange + ½ measuring flange) [kg·m²]</td>
</tr>
<tr>
<td>( J_2 )</td>
<td>Moment of inertia (driven element + cardan shaft + ½ measuring flange) [kg·m²]</td>
</tr>
</tbody>
</table>

A more detailed analysis of the dynamic system response may require the study of publications on structural mechanics. However, the following simplified model of a drive train can often be used.
The torsion spring describes the behavior of the measuring flange deformation zone. The torsional stiffness values \((C_t)\) are indicated in the data sheet in Section 1.2. Both moments of inertia \((J_1\) and \(J_2\)) are generated by the two deformation areas and can be calculated by adding the moment of inertia of each individual element. The moment of inertia of the flange is also indicated in the data sheet. Consult with the suppliers of the couplings, driving element(s) and driven element(s) in order to obtain details on moment of inertia of the other drive train components.

The natural torsional frequency \((f_0)\) determines the response of the torque measuring system and helps to determine whether rapid variations may influence the measuring system or whether the torque is amplified or damped by the drive train dynamics. The transfer curve is shown in Figure 4–2 for various quality factor values \((Q)\), depending on the torsional system damping factor. The graph charts the factor by which the torque will be amplified, depending on the frequency of the torsional oscillations.
Example:

Let us assume a natural frequency $f_0$ of 1000 Hz and a quality factor $Q=10$. A dynamic torque around 900 Hz (close to the natural frequency) would be read by the TF torque flange sensor and amplified by a factor of approximately 6. It is important to note that this amplification is not electrical but mechanical. The risk of overloading the TF Sensor is therefore real.

Note: In practice, the system will be configured and used so as never to get close to the natural frequency of the measuring chain. The $Q$ value must, if possible, be "1". For this reason, the drive train torsional oscillation frequency must be below $\sim 0.5 f_0$.

### 4.3 Maximum Dynamic Amplitude

The dynamic peak-to-peak amplitude must not exceed $400\%$ of the nominal torque of the TF Torque Flange Sensor. This is even true with alternating loads. This amplitude must remain within $-200\% M_{\text{nominal}}$ and $+200\% M_{\text{nominal}}$ as shown in the graph below.

![Figure 4–3 Admissible Dynamic Load](image-url)
PARASITIC FORCES

**CAUTION:** Never exceed admissible limits of torsional momentum, axial or radial forces. The parasitic forces are to be avoided at most.

If the TF Torque Flange Sensor is improperly installed, parasitic forces can act in both radial and axial directions on the sensor.

Radial forces generate torsional momentum on the TF Sensor which alters its center of gravity. The resulting imbalance will periodically load the TF sensor proportional to the rotational speed. The influence of this load increases with rotational speed.

Axial or radial forces, misalignment or unbalance will distort the measuring precision of the sensor. Modulation of axial or radial forces under rotation may cause an anticipated fatigue of the sensor and shorten its life time.

**Note:** The values provided in the table are dynamic limits. The dynamic limit could be much lower depending on the speed of application, balancing quality, alignment and vibrations.

The following table lists the admissible forces and torque which can be applied to the TF Series Torque Flange Sensors without damage.

4.5 TEMPERATURE COMPENSATION

TF Series Torque Flange Sensors are temperature-compensated in their operating range of 20 °C and 85° C in a balanced-temperature environment where the temperature on each face of the measuring flange is the same. When mounted between a warm and a cold element, the TF Sensor displays variations of measuring accuracy. Mounting the TF Sensor in an environment with a thermal gradient between the flange faces must be avoided.
5. Operating Principles

5.1 TELEMETRY PRINCIPLE

Signal transmission between static and rotating components has always been plagued with technical problems. Magtrol's TF Series Torque Flange Sensors provide an interesting solution by using telemetry for signal transmission.

**Figure 5–1 Telemetry Principle Applied to TF Torque Flange Sensors**

5.2 SIGNAL TRANSMISSION

**Figure 5–2 Signal Transmission Block Diagram**
5.2.1 **Measuring Flange to Conditioner**

The torque signal is generated by strain gauges in a full-bridge configuration that are glued onto the inside of the measuring flange. This system has proven its efficiency and reliability over many decades with high measurement accuracy.

The signal delivered by the measuring flange is first amplified, and then sent to a low-pass filter before being digitalized with 16-bit resolution. Afterwards, the signal is modulated for transmission on an HF carrier wave (13.56 MHz). All this is carried out in the electronic module located inside the rotor. The measured signal is then transmitted by induction to the HF transmitter and finally demodulated by the conditioner.

5.2.2 **Conditioner to Measuring Flange**

A similar procedure is also used on the conditioner side which transmits the supply voltage (24 V) as well as the remote calibration signal to the rotor.

5.2.3 **Speed Sensor to Speed Conditioner**

Using the magnetoresistor principle, the (optional) speed sensor delivers a signal to the speed conditioner with a frequency proportional to the rotational speed.
6. Troubleshooting / Maintenance

6.1 DISMOUNTING THE MEASURING FLANGE

When dismounting the measuring flange from the drive train, make sure that all mounting screws are removed including those which are not visible from outside.

CAUTION: NEVER USE THE MEASURING FLANGE FOR LEVERAGE WHEN DISMOUNTING THE SENSOR.

6.3 TROUBLESHOOTING

The following problems may occur with TF Series Torque Flange Sensors:

1. Output signal ($U_{out}$) remains between -10 V and -12 V
2. No output signal / no reaction
3. Signal is at $\frac{3}{4}$ of its nominal value (calibration value) when the measuring flange is unloaded, or the signal varies according to the load.
4. Unstable signal
5. "0" offset (signal behaves normally)

The possible causes of these problems are shown in the following flowcharts.
6.3.1 **Output Signal Remains Between -10 V and -12 V**

1. **Output signal \(U_{\text{out}}\) at \(-10 \text{ V to -12 V}\)

   - Check LEDs on conditioner

     - **Yellow LED** (power supply) illuminated?
       - **YES**
         - Check HF transmitter LED
           - **YES**
             - LED illuminated?
               - **YES**
                 - Possible causes:
                   - Rotor antenna not correctly positioned (distance or alignment) with the rotor
                   - Measuring flange
                   - HF transmitter
                   - Conditioner
               - **NO**
                 - Possible causes:
                   - HF transmitter
                   - Conditioner
                   - Cable
           - **NO**
             - Possible causes:
               - Conditioner power supply
               - Conditioner
     - **NO**
       - Possible causes:
         - Conditioner power supply
         - Conditioner

Possible causes:
- Conditioner
- Measuring flange
6.3.2 **NO OUTPUT SIGNAL / NO REACTION**

2. **No output signal, no reaction**

Check LEDs on conditioner

**Possible causes:**
- Conditioner power supply
- Conditioner

---

Yellow LED (power supply) illuminated?

**YES**

**Possible causes:**
- Measuring flange
- Conditioner

**NO**

**Possible cause:**
- Conditioner

Green LED (synchro) illuminated?

**YES**

**Possible causes:**
- Measuring flange
- Conditioner

**NO**
6.3.3 **Signal at \(\frac{3}{4}\) of Its Nominal Value When Unloaded**

Signal is at \(\frac{3}{4}\) of its nominal value (calibration value) when the measuring flange is unloaded. The signal varies according to the load.

1. Check if system is in calibration mode
2. **Calibration mode?**
   - Yes: Disable calibration mode
     - **Disabling possible?**
       - Yes: END
       - No: Possible causes:
         - Measuring flange
         - Display unit
         - Conditioner
   - No: Possible causes:
     - Wiring between the conditioner and the display unit
     - Display unit
     - Conditioner
6.3.4 **Unstable Signal**

- Green LED (synchro) illuminated?
  - Yes
  - Possible causes:
    - Measuring flange
    - Conditioner
  - No
  - Possible causes:
    - Conditioner power supply
    - Conditioner

- Yellow LED (power supply on) illuminated?
  - Yes
  - Possible causes:
    - Measuring flange
    - Conditioner

- Yellow LED (power supply on) illuminated?
  - No
  - Possible causes:
    - Conditioner

Possible causes:
- Rotor antenna not correctly positioned (distance or alignment) with the rotor
- Measuring flange
- HF transmitter
- Conditioner
6.3.5 "0" OFFSET WITH NORMAL SIGNAL

- Check if conditioner and measuring flange are compatible (see S/N)
- Completely unload the measuring flange
- Adjust the “0” on the conditioner

Possible causes:
- Loaded measuring flange
- Measuring flange
- Conditioner

Note: If you require additional assistance, please contact Magtrol Customer Service.
6.4 **REPAIR**

In case of a defect, please refer to both the *Warranty* and *Service Information* located in the back of this manual.

---

**CAUTION:** *MAINTENANCE MUST BE PERFORMED BY MAGTROL IN ORDER TO GUARANTEE FUTURE MEASURING ACCURACY.*

---

6.4.1 **Defect Report**

To allow Magtrol to complete the work in the best possible time, it is imperative that the following information be documented and included with your return shipment:

- Model number, part number (P/N), serial number (S/N), order number and date of purchase
- Description of the defect and the conditions in which it appeared
- Description of the test bench (drawing, photographs, sketches, etc.)
- Description of the tested object (drawing, photographs, sketches, etc.)
- Description of the test cycle

6.4.2 **Returning to Magtrol**

1. Carefully pack the complete TF Torque Flange Sensor kit (including HF transmitter, conditioner and cable).
2. Include the defect report, as described in *Section 6.4.1*.
3. Follow the procedure outlined in the back of this manual under *Service Information – Returning Equipment to Magtrol SA (Switzerland).*
Magtrol Limited Warranty

Magtrol, Inc. warrants its products to be free from defects in material and workmanship under normal use and service for a period of twenty-four (24) months from the date of shipment. Software is warranted to operate in accordance with its programmed instructions on appropriate Magtrol instruments. This warranty extends only to the original purchaser and shall not apply to fuses, computer media, or any other product which, in Magtrol’s sole opinion, has been subject to misuse, alteration, abuse or abnormal conditions of operation or shipping.

Magtrol’s obligation under this warranty is limited to repair or replacement of a product which is returned to the factory within the warranty period and is determined, upon examination by Magtrol, to be defective. If Magtrol determines that the defect or malfunction has been caused by misuse, alteration, abuse or abnormal conditions of operation or shipping, Magtrol will repair the product and bill the purchaser for the reasonable cost of repair. If the product is not covered by this warranty, Magtrol will, if requested by purchaser, submit an estimate of the repair costs before work is started.

To obtain repair service under this warranty, purchaser must forward the product (transportation prepaid) and a description of the malfunction to the factory. The instrument shall be repaired at the factory and returned to purchaser, transportation prepaid. MAGTROL ASSUMES NO RISK FOR IN-TRANSIT DAMAGE.

THE FOREGOING WARRANTY IS PURCHASER’S SOLE AND EXCLUSIVE REMEDY AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTY OF MERCHANTABILITY, OR FITNESS FOR ANY PARTICULAR PURPOSE OR USE. MAGTROL SHALL NOT BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OR LOSS WHETHER IN CONTRACT, TORT, OR OTHERWISE.

CLAIMS

Immediately upon arrival, purchaser shall check the packing container against the enclosed packing list and shall, within thirty (30) days of arrival, give Magtrol notice of shortages or any nonconformity with the terms of the order. If purchaser fails to give notice, the delivery shall be deemed to conform with the terms of the order.

The purchaser assumes all risk of loss or damage to products upon delivery by Magtrol to the carrier. If a product is damaged in transit, PURCHASER MUST FILE ALL CLAIMS FOR DAMAGE WITH THE CARRIER to obtain compensation. Upon request by purchaser, Magtrol will submit an estimate of the cost to repair shipment damage.
RETURNING MAGTROL EQUIPMENT FOR REPAIR AND/OR CALIBRATION

Before returning equipment to Magtrol for repair and/or calibration, please visit Magtrol’s Web site at http://www.magtrol.com/support/rma.htm to begin the Return Material Authorization (RMA) process. Depending on where the equipment is located and which unit(s) will be returned, you will be directed to either ship your equipment back to Magtrol, Inc. in the United States or Magtrol SA in Switzerland.

Returning Equipment to Magtrol, Inc. (United States)

When returning equipment to Magtrol, Inc.’s factory in the United States for repair and/or calibration, a completed Return Material Authorization (RMA) form is required.

2. Complete the RMA form online and submit.
3. An RMA number will be issued to you via e-mail. Include this number on all return documentation.
4. Ship your equipment to: MAGTROL, INC.
   70 Gardenville Parkway
   Buffalo, NY 14224
   Attn: Repair Department

5. After Magtrol’s Repair Department receives and analyzes your equipment, a quotation listing all the necessary parts and labor costs, if any, will be faxed or e-mailed to you.
6. After receiving your repair estimate, provide Magtrol with a P.O. number as soon as possible. A purchase order confirming the cost quoted is required before your equipment can be returned.

Returning Equipment to Magtrol SA (Switzerland)

If you are directed to ship your equipment to Switzerland, no RMA form/number is required. Just send your equipment directly to Magtrol SA in Switzerland and follow these shipment instructions:

1. Ship your equipment to: MAGTROL SA
   After Sales Service
   Route de Montena 77
   1728 Rossens / Fribourg
   Switzerland
   VAT No: 485 572

2. Please use our forwarder: TNT • 1-800-558-5555 • Account No 154033
   Only ship ECONOMIC way (3 days max. within Europe)

3. Include the following documents with your equipment:
   • Delivery note with Magtrol SA’s address (as listed above)
   • Three pro forma invoices with:
     • Your VAT number
     • Description of returned goods
     • Noticed failures
     • Value - for customs purposes only
     • Origin of the goods (in general, Switzerland)

4. A cost estimate for repair will be sent to you as soon as the goods have been analyzed. If the repair charges do not exceed 25% the price of a new unit, the repair or calibration will be completed without requiring prior customer authorization.
